

Data Audit of Brazilian OLlist Dataset Tables

Olist_orders_dataset

Rows: 99,442

Nulls: A fair amount of timestamp data is blank especially in the delivered carrier date and delivered customer date, some also in order approved at column also.

Olist_order_items_dataset

Rows: 112,651

Olist_customers_dataset

Rows: 99,442

Olist_products_dataset

Rows: 32,952

Nulls: product category has a few blank values, specifically row 130 has 4 columns that are blank. Should I delete this row? There are a lot of rows missing the same 4 column values. These columns are **product_category_name**, **product_name_lenght (spelled wrong)**, **product_description_lenght (spelled wrong)**, **product_photos_qty**

Olist_sellers_dataset

Rows: 3,096

Olist_order_reviews_dataset

Rows: 99,225

Nulls: review_comment_title and review_comment_message have a large number of blank values but this seems normal and expected to me. Not every review will have a comment title or even a comment at all. Review score is much more important to be present constantly throughout the dataset.

Olist_order_payments_dataset

Rows: 103,887

Olist_product_category_name_translation

Rows: 72

Additional Issues: olist_order_payments_dataset contains 103,887 rows versus 99,442 orders.

The discrepancy is explained by installment payments. A single order can generate multiple payment rows. Queries joining this table must aggregate payment values by order_id first to avoid double counting revenue.
